

## Collisions in 2D

(a) Before the collision

$$\vec{P} = \text{const}$$

(b) After the collision

$$P_x = \text{const}$$

$$P_y = \text{const}$$

# Glancing Collisions

- The “after” velocities have x and y components
- Momentum is conserved in the x direction and in the y direction
- Apply conservation of momentum separately to each direction

## Glancing Collisions

When objects do not collide on the same path line, they make glancing collisions.

To solve this type of problem, break it into components!!

$$X: m_1 v_{1i} = m_1 v_{1f} \cos \theta + m_2 v_{2f} \cos \phi$$

$$Y: 0 = m_1 v_{1f} \sin \theta - m_2 v_{2f} \sin \phi$$

**Figure 4.6** An elastic glancing collision between two particles.

$$m_1 v_{1i} = m_1 v_{1f} \cos \theta + m_2 v_{2f} \cos \phi \quad (4.24)$$

$$0 = m_1 v_{1f} \sin \theta - m_2 v_{2f} \sin \phi \quad (4.25)$$

THIS IS A MUCH MORE DIFFICULT PROBLEM

$v_{1fy} = v_{1f} \sin 30^\circ$

$v_{1fx} = v_{1f} \cos 30^\circ$

$v_{2fy} = v_{2f} \sin 45^\circ$

$v_{2fx} = v_{2f} \cos 45^\circ$

$P_{0x} = P_{fx}$

$P_{0y} = P_{fy}$

$m_1 v_{10} + m_2 v_{20} = m_1 v_{1fx} + m_2 v_{2fx}$

$m_1 v_{10y} + m_2 v_{20y} = m_1 v_{1fy} + m_2 v_{2fy}$
